## Time, Distance and Speed

Directions: Use this worksheet to explore the relationship of time, distance and speed using the travel data of the three vessels below.

1. List the ships in order from fastest to slowest. Why do you think some ships traveled faster than others?
2. If the Agulhas II continues to travel at the same average speed, how much distance will it cover in the next 10 hours?

3. If the James Caird traveled twice as fast as it originally did, would it be faster or slower than the Endurance? Please explain your answer.
(MPH is calculated by dividing the overall distance by the number of days, then by 24hrs)

S.A. Agulhas II Days: 11

Miles: 3,22
Average Speed:
MPH

Endurance
Days: 240
Miles: 2,376
Average Speed:

James Caird
Days: 120
Miles: 820
Average Speed:
